

Part 1

Use Proteus to simulate the
Following circuit

First Arduino

1. Connect a Servo motor on pin D9.
2. Use pushbutton in internal pull-up configuration on pin D5.
3. Initiate UART communication between to two Arduinos on pins D2, D3.
4. Receive the potentiometer's value on A0 from the second Arduino using the serial communication and use it to position the servo.
5. Send the pushbutton's state to the second Arduino to toggle the LED on D12.
